

Cylinder Check Point

- With unique one-button quick opening design, easy to operate, operator can observe the internal operation of the machine at any time, check the dewatering effect of each section, and adjust the setting in time.

Ring for Reference

- A special ring is positioned in each zone as reference for comparison to observe the rings and to schedule the overhauling intervention after exceeding the theoretical lifespan.

Pre-thickening Structure in Flocculation Tank

- Pre-thickening structure is an optional module in flocculation tank to improve treatment capacity. With it, sludge can be thickened in flocculation tank; the machine capacity can be improved by more than 50% when it is dealing with sludge with low concentration (about/less than 1%).
